

In this section, we're going to utilize our component library by creating checkout form. Let's create a new html file and call it *checkout.html*:

```
```html
```

Registration information

Name  Email

Address

Zip code  City

Country

Remarks

Terms and conditions ☐ I have read and accepted the terms and conditions

```
```
```

Now trumps:

```
css .buy-now-button { background: #ffa500; color: $ci-red; font-size: 2rem; font-weight: 800; }
```

We discovered how to use the ITCSS architecture in practice and the block element modifier syntax. We also had some cases where we had to take some decisions on naming some classes properly.
